Lecture -10- Inheritance Exercise: Animal and Dog

C# OOP — Inheritance | Time: 15 minutes | Work in groups of 2–3

Task

Create two classes: Animal (parent) and Dog (child).

1. Animal has a constructor that prints "Animal constructor".

2. Animal has a virtual method MakeSound() that prints "Animal makes a sound".

3. Dog inherits from Animal. Its constructor uses base() and prints "Dog constructor".

4. Dog overrides MakeSound() to print "Woof!".

5. In the overridden method, call base.MakeSound() first.

6. Using top-level statements, create one Dog object and call MakeSound().

Expected output (Optional – You Can Print Your Own Messages)

Animal constructor
Dog constructor
Animal makes a sound
Woof!
