Exercise for list

You are developing a simple Shopping List Manager for a supermarket. The program should store products, add and remove products, and display the shopping list. Create a C# Console Application using List<string>.

1. Create a List

- Create a List<string> called products.
- Add "Milk", "Bread", and "Eggs" using Add().

2. Display the Products

- Use foreach to display all products.
- Print the number of products using Count.

3. Modify the List

- Add "Butter".
- Remove "Bread" using Remove().
- Change "Milk" to "Cheese" using its index.

4. Search for a Product

- Use Contains() to check for "Eggs".
- Print "Eggs found" if present; otherwise "Eggs not found".

5. Display the Final List

- Display the remaining products with foreach.
- Print the final number of products.

Starter Code

```
using System;
using System.Collections.Generic;

public class Program
{
    public static void Main(string[] args)
    {
        // TODO 1: Create List<string> products
        // TODO 2: Add Milk, Bread, and Eggs
        // TODO 3: Display all products using foreach
        // TODO 4: Print the number of products
        // TODO 5: Add Butter
        // TODO 6: Remove Bread
        // TODO 7: Change Milk to Cheese using index
        // TODO 8: Check whether Eggs exists
        // TODO 9: Display final list and count
    }
}
```

Expected Output

```
Initial Shopping List:
Milk
Bread
Eggs
Total products: 3

Eggs found

Final Shopping List:
Cheese
Eggs
Butter
Total products: 3
```
