A method receives an integer exam score. Scores from 0–49 are Fail; 50–100 are Pass; scores below 0 or above 100 are Invalid.

C# implementation

```
public class StudentGrade
{
    public static string GetResult(int score)
    {
        if (score < 0 || score > 100)
            return "Invalid";
        if (score >= 50)
            return "Pass";
        return "Fail";
    }
}
```

Equivalence partitions

Partition	Input range	Expected result
A	Below 0	Invalid
B	0–49	Fail
C	50–100	Pass
D	Above 100	Invalid

Each partition represents inputs expected to behave similarly. The two invalid ranges are separate partitions.

Boundary values

Important boundaries: 0 (minimum valid), 50 (passing threshold), and 100 (maximum valid). Test immediately below, at, and above each boundary.

Boundary	Below	At	Above
Minimum valid	−1	0	1
Pass threshold	49	50	51
Maximum valid	99	100	101
